

Ultrasonic pest deterrents **MP1B** (Birds)

The MP1B is a single speaker, single box, bird repellent device. It emits constantly varying but targeted ultrasonic sound to cause irritation to birds, encouraging them to move away from the area. An integrated daylight sensor allows the unit to work in various modes: during daylight, during darkness or continuously.

The MP1B is suitable for simple installations where the repeller has a clear line of sight of the birds. This is important as ultrasonic sound will not pass through any type of solid object. (See drawing below)

Designed for outdoor or indoor use, the MP1B is effective up to 50ft (15m) from the speaker and is supplied ready for use with a mounting bracket which allows the device to be mounted and accurately aimed at the birds or the area to be protected.

- Plug and play install
- Humane bird deterrent
- Designed with specific frequencies to annoy birds
- Up to 15m range in a single direction
- Single speaker design
- Lightweight and can be installed inside or outside
- Includes mounting bracket
- Includes power supply either mains or 12v battery connections
- British designed and built

Specification

- W150 x H120 x D50mm
- 550g (excludes PSU)
- 12v DC Powered
- 10m Power cable
- Wall mounted
- 1 year warranty

Please Note: If using a battery to power the MP1B then use a 12V car or leisure type, either will work but leisure batteries are more suited to this kind of use, and whilst any size of battery will work, consider using a 50ah or greater capacity, this is particularly important if using a solar charger
